Franz Jason C. Dolores

Lapu-Lapu City, Cebu, Philippines • +639999168666 • franzjasondolores@gmail.com • github.com/Aazirr

PROFESSIONAL SUMMARY

Full-stack developer who ships real products for real users. Builds and deploys complete systems end-to-end — from apartment billing platforms with Telegram bot automation and SMS reminders, to cross-platform game server integrations bridging Minecraft and Discord. Experienced with the full web stack (React, Node.js, Express, PostgreSQL), API integrations (Anthropic, PokeAPI, Pterodactyl, Telegram, httpSMS), and production deployment on Railway and Vercel. 2+ years of self-directed Java development through Minecraft modding. BSIT graduate, Cebu Institute of Technology – University.

PROJECTS

Glenda Residences — Apartment Management System github.com/Aazirr/Glenda_Residences

Production billing and tenant management system for a real residential property. Actively used by a live operator. Deployed on Railway.

- Built a React + Express admin dashboard covering the full tenant lifecycle: registration, meter reading entry, electricity/water bill calculation, payment tracking, and SMS reminder delivery via httpSMS
- Designed and implemented a PostgreSQL data model for rooms, readings, bills, and SMS delivery logs; schema migrations run automatically on startup for both PostgreSQL (production) and SQLite (local development)
- Developed a secondary Telegram bot service sharing the same database, supporting command-based billing operations, webhook-driven automation, and on-demand PDF bill generation via pdfkit
- Implemented JWT-based admin authentication with separate credential paths for plain and pre-hashed passwords; webhook endpoints validate a shared secret token to prevent unauthorized requests
- Deployed both services independently on Railway with a shared DATABASE_URL; ephemeral filesystem handled by routing all persistent data through PostgreSQL

DripMon — Cobblemon Tournament & Server Management System github.com/Aazirr/DripMon---Discord • NeoForge mod

Two-repo cross-platform system: a NeoForge Minecraft mod paired with a Discord bot + HTTP bridge, serving a live Cobblemon (Pokémon) multiplayer server community.

- Engineered a bidirectional integration between a Minecraft NeoForge mod (Java) and a Node.js/Express Discord bot over authenticated HTTP, using a shared-secret header with timing-safe comparison to secure all mod-to-bot requests
- Built a real-time chat relay pipeline that forwards Minecraft server events to Discord channels, and surfaces role-gated admin commands (server restart, monitor state) back to the Minecraft server via the Pterodactyl Client API
- Implemented a tournament export system: the mod pushes structured team and Pokémon snapshot data to the bot, which generates a public web viewer enriched with PokeAPI data (moves, abilities, types) and an optional gated weakness-analysis mode
- Reduced PokeAPI latency with a two-tier caching strategy: in-memory cache backed by disk-persisted JSON files, cutting redundant external API calls across sessions
- Integrated player signup flows and team registration with a webapp view of registered teams and Pokémon pulling live data from PokeAPI

Daarkin — Job Application Tracker daarkin.vercel.app

Full-stack web app for tracking job applications across the hiring pipeline. Deployed on Vercel.

- Architected a monorepo with a React 18 + TypeScript frontend (Vite, Tailwind CSS) and a Node.js/Express REST API backend sharing a PostgreSQL database
- Built complete JWT authentication: user registration, login with bcrypt hashing, session persistence, and protected API routes with auth middleware
- Deployed to Vercel using a serverless function adapter to serve the Express API alongside the React static build from a single project

VGC Puzzle Trainer github.com/Aazirr/vgc-puzzle-trainer

Web-based competitive Pokémon (VGC) training tool — chess-puzzle format applied to battle mechanics. In active development.

- Designed full system architecture: Next.js/React client, Node.js/Express API, PostgreSQL database, and a simulation pipeline using the Pokémon Showdown engine to generate puzzle candidates
- Structured three puzzle supply pipelines: simulation-generated, replay-imported from Showdown logs, and community-submitted with a moderation queue
- Planned AI-enriched explanation layer (Phase 2) using the Anthropic API to add learning insights on top of deterministic mechanical explanations

SpeakForge — Multilingual Communication Platform speakforge-capstone2.netlify.app

Capstone project — led a team to build and deploy a multilingual communication platform.

- Led full project lifecycle from planning through deployment using Django (backend) and React (frontend)
- Managed team coordination and REST API integration to deliver a working multilingual system on deadline

EXPERIENCE

IT Intern (OJT) | Ollopa Corporation — Quezon City | *Sep 2025 – Dec 2025*

- Provided IT and system-related support for sales operations in a real-world professional environment
- Identified, documented, and reported bugs and functional issues during website review cycles
- Gained exposure to IT workflows, stakeholder reporting, and production deadlines

Freelance Google Apps Script Developer | Self-Employed | *Jun 2025 – Jul 2025*

- Automated multiple Google Sheets workflows using Google Apps Script, eliminating repetitive manual data entry
- Developed scripts to extract, transform, and push data via external API calls, reducing processing time significantly

TECHNICAL SKILLS

Languages: JavaScript, TypeScript, Java, Python, PHP, C, SQL
Frontend: React, Next.js, HTML, CSS, Tailwind CSS, Vite
Backend: Node.js, Express.js, Django, REST APIs, Webhook Integration
Databases: PostgreSQL, SQLite, Schema Design, SQL Migrations
Integrations & APIs: Anthropic API, Telegram Bot API, Discord.js, PokeAPI, Pterodactyl API, httpSMS, PDF generation (pdfkit)
Automation & Scripting: Google Apps Script, Spreadsheet Automation, API Integration, Data Processing
Deployment & Tools: Railway, Vercel, GitHub, VS Code, ServiceNow, Trello, Google Workspace
Game / Mod Development: NeoForge (Minecraft Java modding), Cobblemon API, cross-platform event-driven systems
Concepts: JWT Authentication, Monorepo Architecture, OOP, SDLC, Webhook Security, Basic Networking

EDUCATION

Bachelor of Science in Information Technology

Cebu Institute of Technology – University, Cebu City, Philippines | Aug 2020 – Dec 2025

CERTIFICATIONS

- Huawei HCIP-Storage V5.0
- Huawei HCIA-Storage V4.5
- Huawei HCIE-Storage V2.5

SOFT SKILLS

Problem Solving • Critical Thinking • Leadership • Verbal Communication • Logical Reasoning • Troubleshooting • Resource Management • Quick Learner • Open to Feedback
